

Saving lines in Calculator

Difficulty:	Easy
Requirements:	Functions
Aims:	Write clear code, abstract

- Take the calculator task and unburden the switch by adding functions for each operation.
Now delete the *subtract* and the *divide* function (and find a way the calculator works anyway).
- **Experts:** add the functionality to exponentiate.
Implement the *exponentiate* function by calling the *multiply* function or by using recursion.

Hints

- How can you subtract through addition?
- You can pass any expression as a parameter.
