Saving lines in Calculator

Difficulty: Easy

Requirements: Functions

Aims: Write clear code, abstract

• Take the calculator task and unburden the switch by adding functions for each operation.

Now delete the *substract* and the *divide* function (and find a way the calculator works anyway).

• Experts: add the functionality to exponentiate.

Implement the exponentiate function by calling the multiply function or by using recursion.

Hints

- How can you substract through addition?
- You can pass any expression as a parameter.
